

SurgyPort-Poppers

A UNIQUE & SAFER WAY TO PROTECT PATIENT PRESSURE POINTS

SurgyPort-Poppers were developed to improve patient safety and reduce the time associated with patient positioning in the operating room. Often patient IV lines, monitors and various pressure points are wrapped with gauze and tape which take expensive operating room time to place and remove. SurgyPort-Poppers are a low cost solution to the costly problem of wasted OR time while also providing outstanding patient protection.

SurgyPort-Poppers are an efficient and effective improvement upon traditional padding due to the superior materials and the fast application time. The soft foam clamshell design is adaptable and can be quickly applied and removed without fear of pulling off or out patient lines and monitors.

Developed by a CRNA. Appreciated by surgeons. Safer for patients.
